FIRE RESISTANCE EVALUATION OF GYPSUM PLASTERBOARD WALLS USING COUPLING METHODS

Problem Description

- gypsum plasterboard walls are commonly used in constructions, providing passive fire protection as separating elements
- the fire resistance of the wall is assessed by performing expensive fire tests or conservative empirical calculations

Objectives & Tasks

- this work aims to evaluate the fire resistance of gypsum plasterboard lined walls by means of fluid-structure-interaction based simulations
- using coupling methods between reduced combustible gas flow and structural mechanics validation of the physical models and reduction of fluid flow simulation
- preferred software packages for fluid flow: ANSYS Fluent or LS-Dyna as well as structural mechanics: ANSYS Mechanical or LS-Dyna
- strong skills in understanding and interfacing complex physical effects as well as model reduction
- experience in programming (Python, FORTRAN) is a plus
